

Intro to Electronics

Electricity, Electronics, Transduction, Circuits, Ohm's Law
Definition of Components
Using a Multimeter
Reading schematics
Soldering

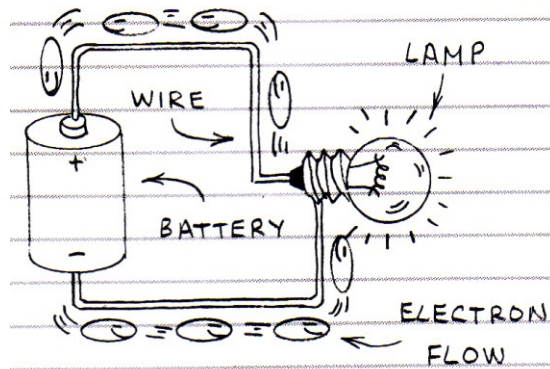

Electricity

- Form of energy resulting from the existence of charged particles (such as electrons or protons), either statically as an accumulation of charge or dynamically as a current.
- Is the flow of electrical power or charge.

Electricity

29: Copper

2,8,18,1

Electronics

- Devices that work by controlling the flow of electrons

Transduction

- The conversion of one type of energy into another.

Electric to Light

Electric to Rotational

Electric to Heat

Circuits

A closed path formed by interaction of electrical components through which the electric current can flow.

Key Terms

Voltage (V):

Potential difference in circuit

Unit: Volt (V)

Resistance (R):

a measure of the degree to which an object opposes an electric current through it.

Unit: OHM (Ω)

Key Terms

Current (I):

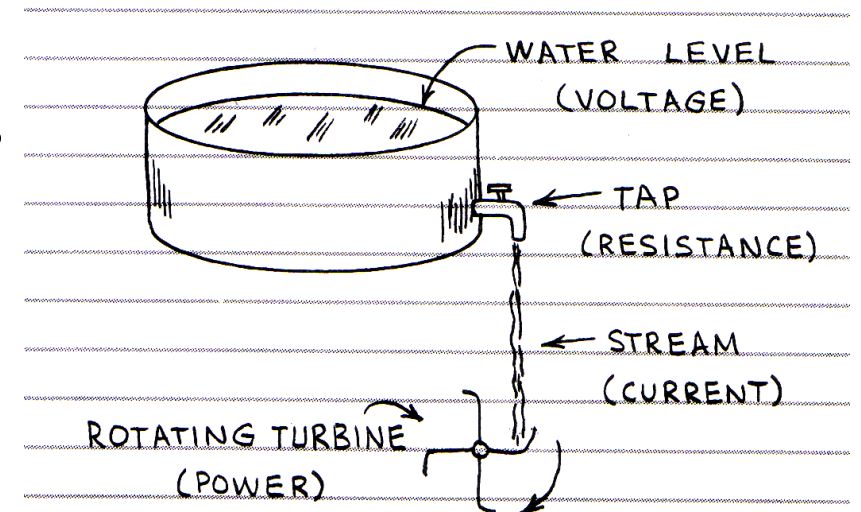

Quantity of electrons passing a given point.

Unit : Ampere (A)

Power (P):

Work done by electrical current.

Unit : Watt (W)

Ohm's Law

- For a given resistance, voltage across the two points is directly proportional to the current between them.

$$V = IR$$

$$I = V/R$$

$$R = V/I$$

Definition of Components

Connectors:

Hook-up Wires

Alligator Clips

Breadboard

Definition of Components

Resistors:

Color code:

Black	0

<http://itp.nyu.edu/physcomp/Labs/Components>

Multimeter

- Also called Volt/OHM Meter (VOM)
- Ability to measure Voltage, Current and Resistance

Reading Schematics

- A schematic is a diagram representing a circuit in which:
Symbols represent components,
Lines represent wires.

Schematics

http://www.rapidtables.com/electric/electrical_symbols.htm

Soldering

TIPS:

- Never touch the tip of solder iron.
- Always return the iron to the stand once soldering is done.
- Well-ventilated area.
- Wash your hands after using solder.

Soldering

Always feed solder to joint and
Solder iron to solder.

Good solders are quick joints.

Digital In/Out

Microcontroller

Arduino

Lab

Micro-processor

- incorporates most or all of the functions of a central processing unit (CPU) on a single integrated circuit (IC).

Micro-controller

- Consists of microprocessor combined with support functions such as a crystal oscillator, timers, watchdog, small amount of RAM, serial and analog I/O etc.
- Microcontrollers are designed for small or dedicated applications.

Microcontroller

Arduino

- Is a tool for making computers that can sense and control more of the physical world than your desktop computer.
- Can be used to develop interactive objects, taking inputs from a variety of switches or sensors, and controlling a variety of lights, motors, and other physical outputs.

Arduino Types

- Manufactured differently which serve different chip size / needs.

Mini light
Pro Mini
Nano
LilyPad
Pro
Diecimila,
Duemilanove
Bluetooth
Mega

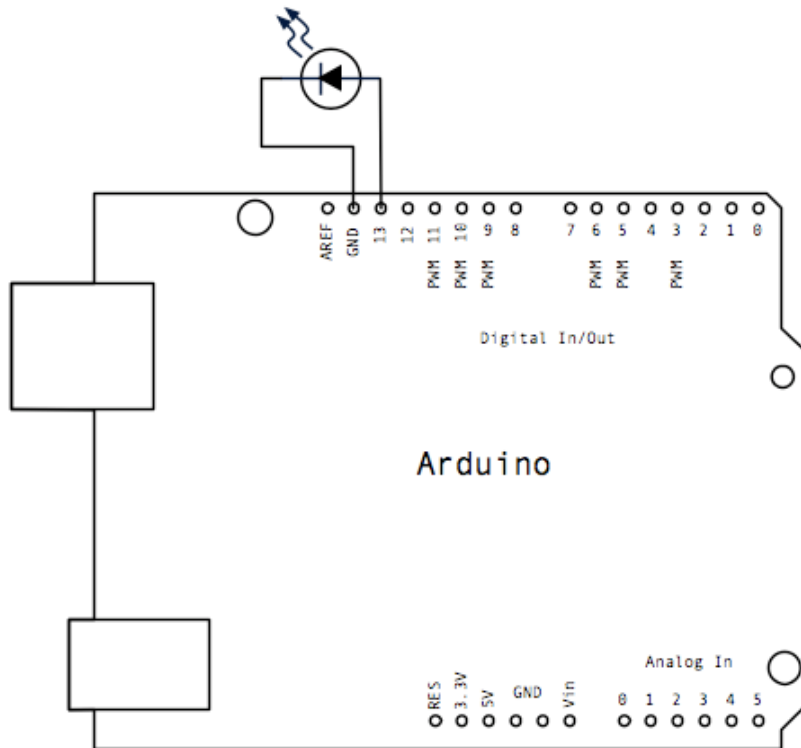

Processor Programming

Programming a processor is basically to assign new functions to the microprocessor.

Arduino uses C coding to program its microprocessor.

Arduino developed its own platform (software) to code its processor. www.arduino.cc

Blink : Hardware

Blink : Code

```
int ledPin = 13;    // LED connected to digital pin 13

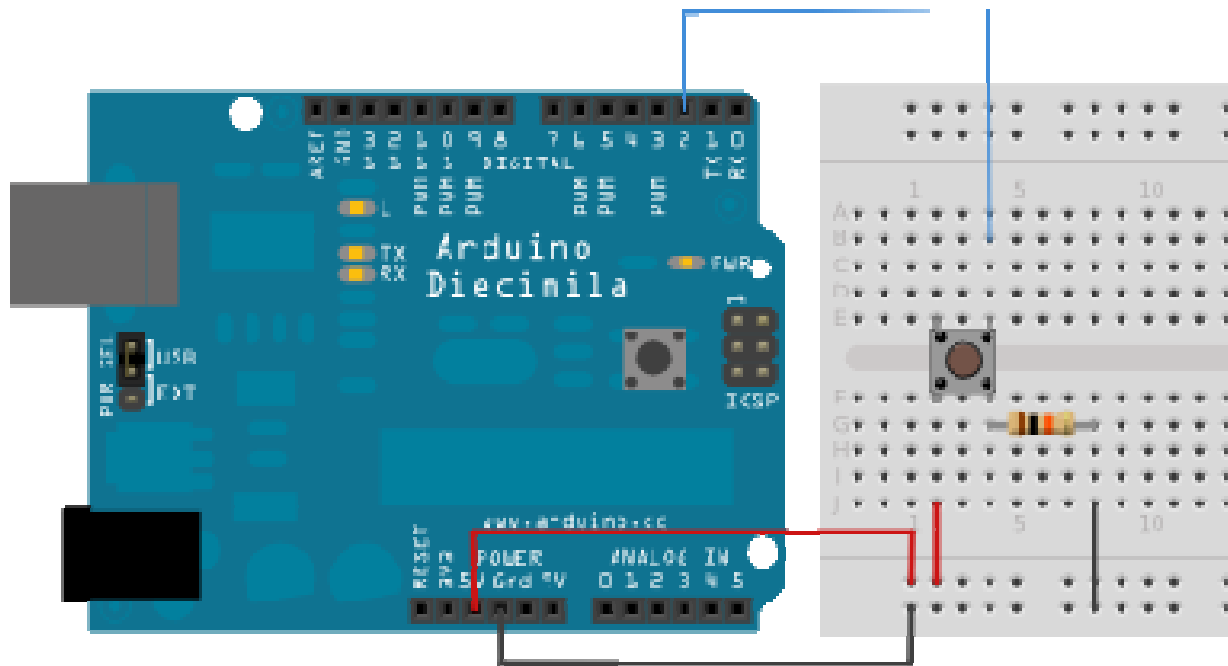

// The setup() method runs once, when the sketch starts

void setup()  {
  // initialize the digital pin as an output:
  pinMode(ledPin, OUTPUT);
}

// the loop() method runs over and over again,
// as long as the Arduino has power

void loop()
{
  digitalWrite(ledPin, HIGH);  // set the LED on
  delay(1000);                 // wait for a second
  digitalWrite(ledPin, LOW);   // set the LED off
  delay(1000);                 // wait for a second
}
```

Arduino : Button

Code

```
// constants won't change. They're used here to
// set pin numbers:
const int buttonPin = 2;    // the number of the pushbutton pin
const int ledPin = 13;      // the number of the LED pin

// variables will change:
int buttonState = 0;        // variable for reading the pushbutton status

void setup() {
    // initialize the LED pin as an output:
    pinMode(ledPin, OUTPUT);
    // initialize the pushbutton pin as an input:
    pinMode(buttonPin, INPUT);
}

void loop() {
    // read the state of the pushbutton value:
    buttonState = digitalRead(buttonPin);

    // check if the pushbutton is pressed.
    // if it is, the buttonState is HIGH:
    if (buttonState == HIGH) {
        // turn LED on:
        digitalWrite(ledPin, HIGH);
    }
    else {
        // turn LED off:
        digitalWrite(ledPin, LOW);
    }
}
```
