

Reflect on the readings and discussions that we have had during the second block of the seminar and write an essay that addresses its underlying questions:

How does an extreme range of scale appear in networks now, how has that range emerged, and what changing status does it indicate for ecology, for the built environment, and for humans?

The paper should be approximately 2000 words in length plus footnotes and bibliography. Please format your bibliography according to MLA standards ([here's an example.](#)) Use at least two sources that were not included in the assigned readings.

Due: 24 April 2014 / email your .doc. pages, pdf or google doc to jordang@buffalo.edu
